

Towards a common playground for the Mediterranean integration

Final Report

Monitoring and Implementation of the Guidelines for the Mediterranean Grid Codes

GRANT CONTRACT - EXTERNAL ACTIONS OF THE EUROPEAN UNION - ME/P2021/0081

TASK 2 Consolidation of common technical regulatory framework

Activity 2 Monitoring and Implementation of the Guidelines for the Mediterranean Grid Codes

Deliverables

- Del. 2.1 A Survey of applicability and alignment with current needs
- Del. 2.1 B Proposal of a Grid Code Guidelines aligned with the survey
- Del. 2.1 C Monitoring of the adoption and implementation process in the Med-TSO members countries and stakeholders' engagement to improve them

1. Purpose of the report

The report is associated to Task 2 "Consolidation of common technical regulatory frameworks", Activity 2 "Monitoring and Implementation of the Guidelines for the Mediterranean Grid Codes" of the TEASIMED project. A call for tender ME/P2021/0081 has been issued and the work has been assigned to ENGIE Impact.

The objective of this report is to propose Grid Code Guidelines for the key areas of convergence among the involved stakeholders of the Med-TSO Members' power systems. Such Guidelines should be focused on these key areas, which will be identified through a dedicated survey, and will include a proposed structure for a potential future grid code. Figure 1-1 shows an overall overview of the project.

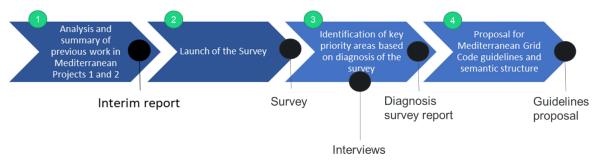

Figure 1 - Overview of the project

This document is organized is two main parts. The first part summarizes the main outcomes of both the survey and list of interviews. The second part, starting at chapter **Errore.** L'origine riferimento non è stata trovata., details the development of a tool for defining the necessary grid code guidelines.

The document contains the following chapters:

- Chapter 2 Identified barriers and lessons learnt: Although this is not strictly speaking part of the original scope of work, throughout the analysis and interviews some interesting messages on the regional development of the Mediterranean electricity sector came forward. These are summarized in this chapter.
- o PART 1: SURVEY
 - Chapter 3 Preparation of the survey
 - Chapter 4 Results of the survey
 - Chapter 5 Results of the interview

3

- o PART 2: degree of integration & GRID CODE GUIDELINES
 - o Chapter Errore. L'origine riferimento non è stata trovata. degree of integration
 - o Chapter 7 Mapping of priorities for Mediterranean Grid Code Guidelines
- O Chapter 8: Conclusions
- o Chapter 9 : Appendices

2. Identified barriers and lessons learnt

Throughout this study and in discussion with stakeholders, several interesting lessons were learnt and barriers that are hindering the regional integration became evident.

It is clear that not every member TSO of Med-TSO has the same objective when discussing regional integration. Not every country intends to adopt the European system, with a completely integrated regional market, but rather prefers to be able to trade energy or assure mutual emergency support. This is however not a negative point. Collaboration can very well exist between various regulatory frameworks. It is nonetheless necessary to understand the fact that various objectives exist in the light of this report on developing Grid Code Guidelines.

It is important to note that the development of Grid Code Guidelines in itself is not the objective. They are rather one of the building blocks that are needed for further integration in the Mediterranean region. The current lack of a common regulatory framework is in the opinion of most interviewed stakeholders not identified as a real bottleneck of the further development of the region.

The main driver for further regional integration of the electricity sectors is institutional buy-in. Support from political or institutional level is found to be a key for realizing projects. Some form of agreement is needed between the stakeholders, justifying the investments. However, the format is not the most important. A regulatory framework can have many formats (e.g., a bilateral agreement, a memorandum of understanding, some kind of regional framework...), and will be decided case by case.

The further development and integration of the electricity sector in the Mediterranean region, will foster further geopolitical stability, as a reliable electricity supply is an important economic driver. At the same time, a stable investment climate is needed for guaranteeing investment in regional projects.

PART 1: SURVEY DIAGNOSIS AND INTERVIEWS

3. Preparation of the survey

3.1. Survey content and practicalities

The Mediterranean Projects 1 and 2 laid out the basis for the development of a common framework for the harmonization of rules in the area. The key differentiator of this survey with respect to the previous work performed by Med-TSO is the targeting of the survey to various types of stakeholders involved in the electricity sector (TSOs, DSOs, developers, governments/institutions, regulators, ...).

The survey was consequently built in line with the previous work of Med-TSO – which relies mainly on contributions from TSOs – in order to confirm that the conclusions are indeed representative of all stakeholders involved in the power system. In that frame, the survey considered the same 4 broad categories (Legal & Regulatory, Connection, Operation and System Services Market) and the 34 aspects identified in the Common Target Regulatory Framework which are presented for ease of reference in figure 2.

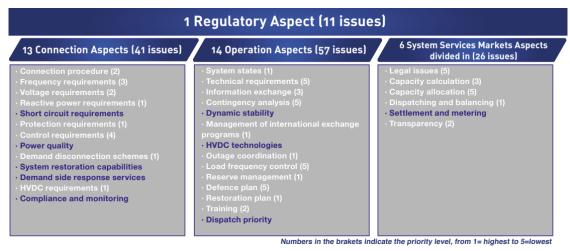

Figure 2-1 Priority aspects for harmonization as per the CTRF

The core of the survey took the form of a number of statements covering each aspect above over which the participant had to agree or disagree on a scale from 1 to 9 (0 meaning that the statement is irrelevant for the stakeholder). It was finally enriched with a number of open questions covering topics such as

- Stakeholder type represented (TSO/DSO, Government/Institution, Developer, Regulator);
- Expected improvements from increased interconnection/energy exchanges;

- Level of geographical harmonization (none, bilateral agreement, regional harmonization, whole Mediterranean region);
- o To what extent non-harmonization can be a barrier for investment/operations/cross-border trade.

3.2. Stakeholders contacted and answers description

The survey was sent under the format of an excel spreadsheet (for ease of use and collaboration) to a list of contacts set up in close collaboration with Med-TSO. A total of 110 contacts (not necessarily based inside the Med-TSO area but with activities in the area) were reached covering a wide panel of stakeholder types as well as various geographical areas as shown in Figure 3-

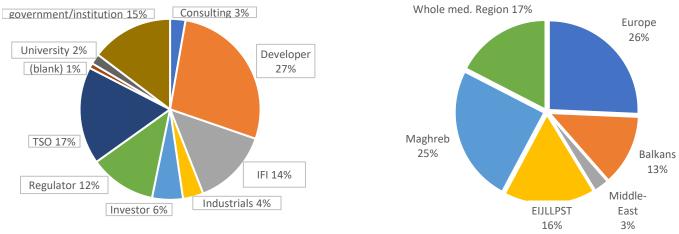

Figure 3- Contact list details

Out of the 110 surveys sent, we received a total of 15 answers from a wide variety of types of stakeholders well dispatched around the Mediterranean area as shown in

Figure 4.

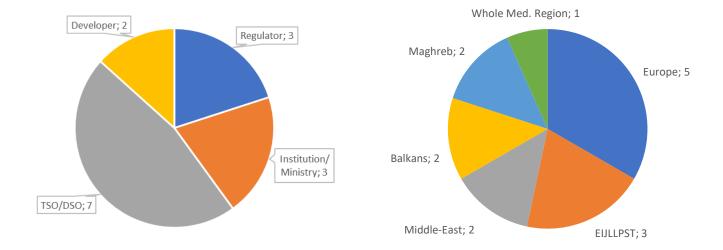

Figure 4- Details of answers received

9

4. Results of the survey

The results of the survey are summarized in this section. Whenever relevant, they are compared with the results of the previous Med-TSO work (Common Tentative Regulatory Framework - CTRF) whose results are reminded in Figure (1. Operation, 2. Connection, 3. System services Markets, 4. Legal).

As a reminder, these results were obtained based on contributions from TSOs only.

Figure 5 - Issues considered for Harmonization

4.1. Overall results

It can be seen in Figure 6 that the Operation category is the first priority with an average score of 7.4. The three other subjects are close to one another – between 6.8 and 6.9 average score. With respect to the CTRF,

- 1. The Operation category is indeed confirmed as the main concern for harmonization;
- 2. The Legal aspect which was lagging behind in the CTRF is given a greater importance in this survey;
- 3. The Connection and Market categories are equally as important and in line with the conclusions of the CTRF.

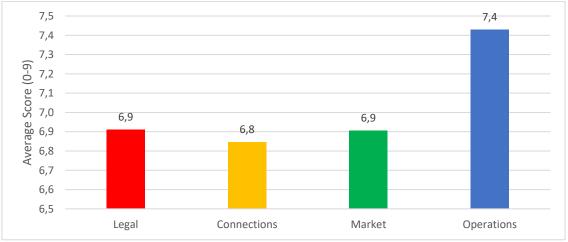

Figure 6 - Survey results per theme

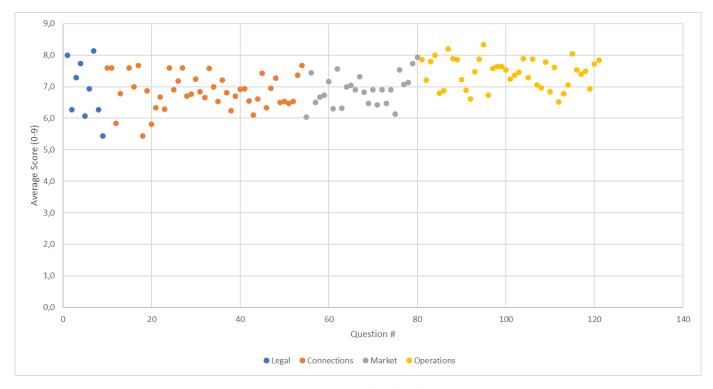

Figure 7 Scatter plot all results

Figure 7 shows individual responses to all questions. There are no large variations between the various answers. Therefore, it is difficult to classify issues according to priority based on this survey.

The following sections will explain more in detail converging and diverging aspects between this survey and the CTRF.

4.1.1. Trends per stakeholder type

Figure 8 shows that opening the survey to various stakeholder categories allowed to capture a wide range of opinions on each of the four categories.

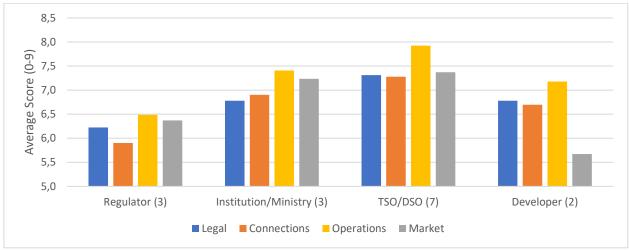

Figure 8 - Survey results per category and per category of stakeholder

The key takeaways of these results are given hereunder. A statement from answers to open questions is given whenever relevant.

- The "operations" category comes in first no matter the stakeholder group;
 "The operations must be as simple as possible and easy controllable, ensuring flexibility and readiness on both sides. This is more easily achieved, for examples, with harmonized systems and well-defined and harmonized operational/technical requirements"
- The regulators give credit to the "market" and "legal" categories in which they have a major part of their activities;
 - "Perhaps the most important legal aspect to be implemented for facilitating energy exchange is setting up a regulatory framework allowing for transparent and cost-reflective third-party access to interconnections"
- TSOs and DSOs vision is centred around the "operations" category and more broadly on technical considerations to ensure the stability of their system;
 - "[...] Coordination between both TSOs is essential. The lack of rules, measures, and procedures to put in place in the operation of networks could limit the effective and efficient functioning of interconnected systems."
- o Developers really seek a stable legal framework to facilitate investments.

"Legal harmonization should take the form of a standardized grid code template across the region, with a similar layout no matter the country. Even if the actual content would change, it would ease data collection regarding each country technical requirement."

4.1.2. Trends per geographical area

Some general trends may also be extracted from the split per geographical area as shown in Figure 10. In this figure, the areas were sorted per level of maturity of the interconnected system and market. To date,

The Maghreb countries exchange today limited levels of energy on a bilateral basis which can explain why their focus is more on the legal category which is a mandatory prerequisite before structurally increasing the cross-border exchanges.

- The Europe countries on the other hand are part of a fully interconnected system inside an integrated market where cross border exchanges are significant. As a direct consequence, the legal aspects have been harmonized through the ENTSO-E grid code and the focus is more on technical and market considerations, to fully grasp the economic benefit of the integrated market.
- The level of interconnection of the three other areas lies somehow in between the two previous extremes, which is why the opinions are more divergent. Nevertheless, operation-related topics still come in first no matter the area.

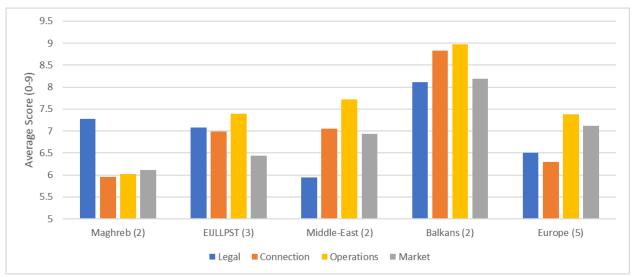

Figure 9 - Survey results per category and per geographical region

4.2. Focus on operation aspects

The detailed results of the Operation category, split per aspects identified in the CTRM, are shown in Figure 10. The results show a good alignment between the two studies: the stakeholders give a lot of credit to restoration processes, outage coordination, and management of international exchanges for harmonization.

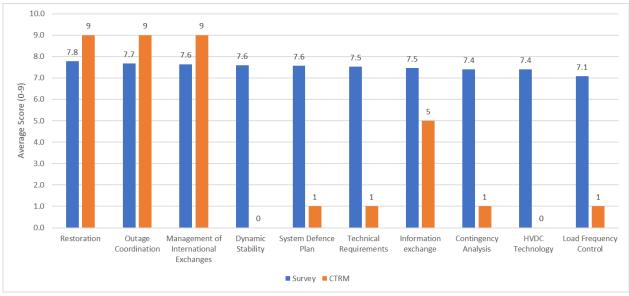

Figure 10 - Operation aspects: comparison between this survey and the CTRM (Common Target Road Map)¹

Operations is the only category whose overall importance was confirmed by this survey which also explains why the alignment of the various aspects is satisfying.

4.3. Focus on legal/regulatory aspects

Larger discrepancies can be observed when looking into the questions related to regulatory and legal aspects, as can be seen in Figure 10.

¹ Survey results are averages of all received replies. Scores of the CTRM are ranked per priority (9 the highest -1 the lowest). Results cannot be compared one-on-one, but importance can be deduced.

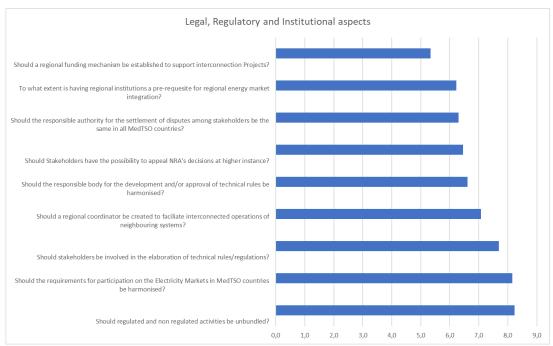

Figure 10 Legal and regulatory aspects

4.4. Focus on connection aspects

The alignment between this survey and the CTRM is less good than for operations as shown in Figure . Nevertheless, the following aspects are confirmed as key between the two studies: HVDC technology requirements, frequency, and voltage requirements.

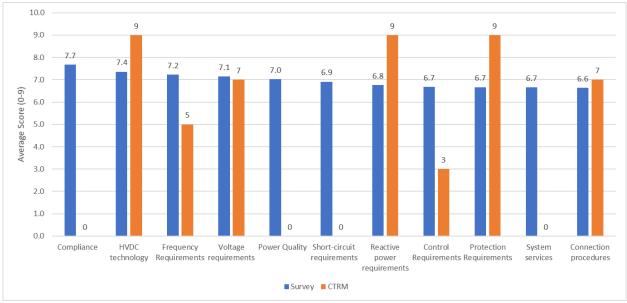

Figure 11 - Connection aspects: comparison between this survey and the CTRM

4.5. Focus on market aspects

The alignment between this survey and the CTRM is less good than for operations as shown in Figure . Nevertheless, transparency of data is confirmed as a key aspect from both studies.

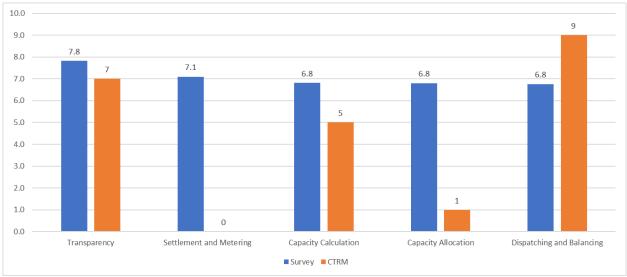

Figure 12 - Market aspects: comparison between this survey and the CTRM

4.6. Main outcomes from the open questions

The answers to the open questions gave meaningful insights on each participant vision. Some general trends are summarized hereunder and confirmed by explicit statements whenever relevant

- Key takeaway 1: Most participants give on the short-term a lot of credit to legal harmonization which they see as a quick win to encourage investments and to improve reliability.
 - "Perhaps the most important legal aspect to be implemented for facilitating energy exchange is setting up a regulatory framework allowing for transparent and cost-reflective third-party access to interconnections"
 - "Technical harmonization most of the time can be resolved. However, regulatory framework is seen as a key [...] to build business cases."
 - o "[...] Therefore, there is a strong need to ensure compatibility of legal, regulatory, market and commercial rules on both sides of neighbouring countries"
 - "[...] Regional regulatory institutions are essential for the formation of a variety of agreements and harmonization of market design and regulatory policies, regardless of the degree of power system integration."
- Key takeaway 2: Most participants confirm that they see poor attractiveness for investment and higher
 electricity prices as direct consequences of a lack of harmonization inside a geographical area.
 - "Non-harmonization is a significant barrier for investment in cross-border projects provided that these projects are conceived for system purposes"
 - "Non-harmonization can lead to a significant increase on the investments needed, resulting on higher costs and therefore less attractiveness. [...]"
 - "Lack of harmonization can lead to increased costs of activities related to energy sector [...]"
 - "Economic gains from increasing exchanges (for example through a medium-long term reduction in energy prices); [...]"
 - "Lack of harmonization can lead to increased costs of activities related to the energy sector. Further it
 can reduce the efficiency and effectivity of activities since that without certainty of transmission access,
 stable cash flows, and regulatory predictability, private investors would be unlikely to invest. [...]"

- Key takeaway 3: Most participants recommend capitalizing on successful harmonization initiative (such as ENTSO-E) and to adapt and extend these rules to other Mediterranean countries.
 - "Harmonized regulatory framework and technical rules are already existing at EU Level, and should be extended to other MED countries"
 - "Some expertise and know-how could be learned from successful examples in EU, as the definition of Iberian Electricity Market (MIBEL), Baltic Electricity Market (BEMIP)"
 - "TSOs that are members of ENTSO-E are already obliged to implement and respect the agreed rules.
 Documents such as The Synchronous Area Framework Agreement (SAFA) consider all the aspects mentioned in questions below."

5. Results of the interviews

This chapter highlights the main takeaways from the three interviews which have been conducted to date as a followup of the survey. The full interview notes can be found in appendix of this report.

5.1. Egypt ERA

EgyptERA is the regulatory body for Egypt. As expected for a regulator, EgyptERA confirmed that the key areas to be harmonized for them concern legal/regulatory, and market aspects. The operations considerations are less of an issue for Egypt since they are already well in place in the country.

Regarding the will to be integrated in an electricity market, the short-term vision of the regulator will be to continue with bilateral long-term contracts for their projects (with Greece and Saudi in HVDC), in order to limit the risks. As a result, EgyptERA encourages for legal/regulatory harmonization at a regional level rather than at the Mediterranean level. Nevertheless, on a long-term basis, Egypt hopes to be integrated in an electricity market with EAPP. Their objective in doing so would be to integrate more renewables in their system. They foresee to keep on exporting electricity in the future.

5.2. Energy Community

Energy Community confirmed that their main focus area lies in the market aspects. They state that there is no need for developing a unique grid code for the Mediterranean Region, as the ENTSO-E Network codes are existing and can be used.

Regarding energy exchanges, Energy Community also identified a barrier related to energy exchanges between member and non-member countries of ENTSO-E which is key in their geographical area dealing with the Western Balkans and the Black Sea region.

5.3. European Commission – DG Energy

One of the key takeaways from the interview is that the European Commission can play a key role in the integration of the Mediterranean region, by financing projects through their Project of Common Interest (PCI) list. In order to be added to this list, projects should be proposed by member states of the EU. The DG also makes a clear distinction

between synchronization between countries, more related to technical barriers, and significant energy exchanges through the interconnector, related to legal, regulatory, and political willingness.

PART 2: GRID CODE GUIDELINGES & DEGREE OF INTEGRATION

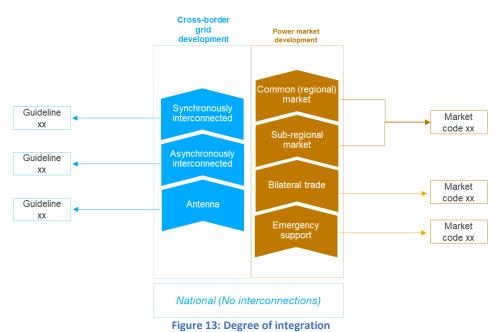

6. Degree of integration

Through analysis of previous work and during interviews with stakeholders, it is clear that different regions aim for different levels of regional integration. This can be because certain regions have a different pace of regional development (e.g., Europe, where through ENTSO-E, regional integration is high on the agenda for several years, decades). But some countries do not have the same ultimate objective.

This makes is difficult, if not impossible, to develop a same set of grid code guidelines. Certain regulatory aspects and technical requirements are specifically linked to a certain "degree of integration". We therefore propose to introduce a new concept. The degree of integration defines to what level national power systems are regionally interconnected and integrated with each other. This degree of integration can be defined in two dimensions:

- Cross-border grid development: This indicator indicates the level of physical interconnection between countries.
- Power market development: This indicator indicates how trade and/or energy exchange is organized between countries.

The concept is illustrated in Figure 13. It is important to note that countries do not necessarily need to evolve in both dimensions to the same level. It is perfectly possible to have two meshed synchronous interconnections that are only trading through bilateral agreements, without the intention to develop a common market. On the other hand, these dimensions are not completely independent from each other. Interconnection is needed if energy is exchanged. With a further degree of market interconnection, a more developed level of cross-border interconnection is expected, as summarized in the scheme in Figure 14.

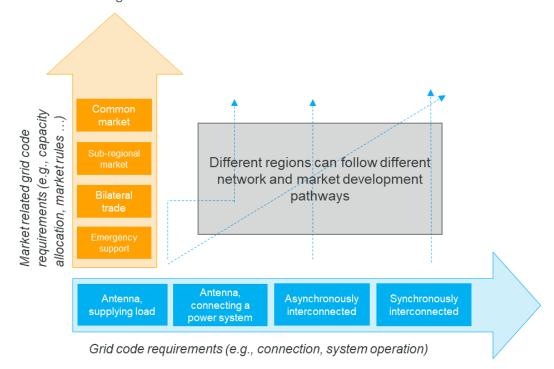

Figure 14: Link between the two dimensions of degree of integration

The following degrees in both dimensions can be defined:

Cross border grid development:

- No interconnection: Two countries are currently not interconnected
- O Antenna: Two territories are only interconnected as in antenna. I.e., there is no meshed system present (also not via a third territory/Power System), and loop flows are not possible between the two concerned Power Systems. This also means that metered exchange on the interconnection equals the traded energy. Two distinctive cases are possible:
 - o Antenna supplying load only: There is no generation present in the second Power System;

- Antenna connecting a Power System: There is generation present in both Power Systems.
- Asynchronously interconnected: Two Power Systems are only connected through HVDC lines and are operated asynchronously.
- Synchronously interconnected: Two Power Systems are connected through multiple AC lines and can be considered as a meshed system.

Power market Development:

- o <u>No interconnection:</u> Two Power Systems are currently not interconnected
- Emergency support: Two or more Power Systems are interconnected; however, the purpose of the interconnectors is limited to providing mutual back-up assistance during emergency operating conditions. Some administrative settlement mechanisms are agreed upon between the system operators on both ends of the interconnector.
- <u>Bilateral trade:</u> In this case, the interconnectors are utilized not only for emergency support, but power could be exchanged between interconnected systems from a country with cheaper generation cost to the expensive one. However, this trade is limited to bilateral agreements between two neighbouring Power Systems. In this case, a short-term organized electricity market can be established to facilitate the trade depending on the maturity of the national electricity markets. Otherwise, only a long-term power purchase agreement can be signed between the neighbouring systems or together with short-term market.
- Sub-regional market: Like the bilateral trade, also in this case the interconnectors are utilized beyond emergency needs. However, more than two interconnected Power Systems participate in the power trading agreement. This would naturally require organized markets to facilitate the short-term exchanges of power besides the long-term agreements.
- Common (regional) market: In this case, the geographical scope the power market grows beyond bilateral and sub-regional levels, to regional market. That is, the interconnectors are open to any market player and prices are determined by the dynamics of supply and demand in the concerned systems. The success or market efficiency of such regional market highly depends on the maturity of the national systems and the openness of the generation system to market competition.

Next to this report, a table has been prepared where for each degree of integration, it is indicated what clauses and grid code articles are relevant for said degree of integration. The individual clauses and grid code articles that are identified are based on the work done in Mediterranean Project 1 and 2. In that work a Proposal of a Common Target Regulatory Framework was proposed, indicating priority issues for the development of Mediterranean Grid Code Guidelines.

They are organized in four categories:

- Legal and regulatory issues
- Connection to the grid
- Operation of the interconnected systems
- System Service Markets

This concept of degree of integration can be used in several ways.

- Firstly, it can be used to identify whether there are any gaps in the current regulatory framework that guides the integration between two or more Power Systems. By defining the current degree of integration, the tables developed in this work will summarize what clauses and grid code articles are needed for governing such collaboration. If any seems missing, this can be considered as a gap in the current framework.
- The table can also be used for defining what Grid code guidelines should be further developed, if the integration between two Power Systems will be further developed.

7. Mapping of priorities for Mediterranean Grid code Guidelines

This chapter is complementary to the excel tool that is developed in the frame of this assignment. The excel tool indicates what elements in future Grid Code Guidelines are relevant for each degree of integration, as introduced in the previous chapter.

The various topics under these four following categories, are the topics that are identified in previous work:

- Legal and regulatory issues
- Connection to the grid
- Operation of the interconnected systems
- System Service Markets

The below sections, provide additional information for the various sections on how the excel tool was filled in.

7.1. Legal and Regulatory issues

The topics raised in this category were defined with the purpose of having a clearer picture of the suitable level of harmonization needed in the different areas identified as relevant, based on the previous analysis made and the opinion of Med-TSO members. Both the dimension on cross-border development and the dimension on power market development are considered and presented in the excel tool. However not every topic is relevant for both dimensions. Not every topic raised in this category are a *conditio sine qua non* for further development and is as such not highlighted in the table.

A first analysis led us to the observation that a stronger regulatory framework is needed when moving towards a common market. As long as exchange is limited to bilateral trade, much less of a solid framework must be in place. It is also the Consultant's opinion that a single responsible authority for settlement of disputes in the entire Med-TSO's region is never a prerequisite.

	Cross-border development			Power market development				
Issue	Antenna, supplying load	Antenna, connecting power systems	Asynchronously interconnected	Synchronously interconnected	emergency support	bilateral trade	sub-regional market	common (regional) market

Clarity on whether various activites of the power system including Production, transmission, distribution, trading on injection, trading on consumption, metering are different competent authorities (Ministries, TSOs, independent bodies)							✓	√

Figure 15: Mapping of legal and regulatory issues

7.2. Connection to the grid

In this category, again both dimensions in the degree of integration (i.e., cross-border development and power market development) are relevant. However, all connection related requirements will be applicable at all market development phases.

Topics related to access and capacity calculations are typically linked with both cross-border development and power market development. Technical requirements on the other hand, are only related to the cross-border development dimension.

7.3. Operation of the interconnected system

This category of Grid Code Guideline topics is only linked to the physical structure of the system (i.e., the cross-border development dimension).

As expected, the most differentiating factor between the degrees of integration, is the fact whether a system is synchronously interconnected or not.

	Cross-border development

7.4. System Market Services

The market development builds on the development of the grid infrastructure. That is, without sufficient grid infrastructure, it would be challenging to develop efficient regional markets. Therefore, in this category, both dimensions in the degree of integration (i.e., cross-border development and power market development) are relevant. The relevance of the requirements/issues grows with the evolution of the power market. For instance, it can be observed that, when the interconnector is used only for emergency purposes, the requirements are limited to a few cross-border capacity management, general agreements, settlement and metering mechanisms and transparency issues. In contrast, all requirements need to be fulfilled to ensure efficient common regional market.

Figure 18: Mapping of market related topics

8. Conclusion

The objective of this report is to advance towards harmonization of the development of a common set of basic rules in the Med-TSO region. A proposal regarding common set of basic rules for the entire region, with focus on TSOs responsibilities and functions, is the deliverable target of this task. Such efforts pave the way for a future common Mediterranean electricity market. A common market will enable sharing resources through cross border exchanges and therefore increasing the reliability of energy supply across the region. To that extent, additional stakeholders were surveyed and interviewed for capturing the input of more types of stakeholders.

Limited feedback was received. From more than 100 surveys that were sent out, 15 replies were received, and three interviews were conducted. Moreover, most of the results were homogeneous. These results do not allow to identify clear priorities or key messages from the targeted audience. Results that are received do not deviate from conclusions that were made during previous stages (i.e., Mediterranean Project 1 and 2). It is reassuring to observe that priorities of contacted stakeholders do not deviate a lot from previously identified priorities, which were mainly TSO driven.

It remains an open question, whether the limited interest in this exercise to map the priorities in further harmonization is linked to the fact that this is not the highest priority of the stakeholders, or whether Mediterranean Projects 1 and 2 laid out sufficiently the way forward.

The main outcome from the interviews is that, before all, a common interest is needed to make regional cross-border projects a success. The lack of common grid code guidelines is not necessarily the biggest barrier. It is true that harmonization is needed up to a certain extent. It is also clear that various players have different views on regional integration, and not all parties around the Mediterranean have the same objectives.

It is important that required investments for realizing regional projects can be secured. At the same time, some kind of agreement is needed between stakeholders of various initiatives. This can be under the form of a bilateral agreement, a memorandum of understanding, a regional framework, etc Both aspects can be mitigated by a certain degree of harmonization, nonetheless. It is however necessary to keep in mind that harmonization is not the objective itself, but rather one of the bricks towards more regional integration.

Another very important message that was received during the interviews is that institutional buy-in is essential for pushing the regional integration.

In this study a new indicator is introduced, called degree of integration. The degree of integration defines to what level national power systems are regionally interconnected and integrated with each other. This degree of integration can be defined in two dimensions, cross-border grid development and power market development. The former is linked to the physical assets where the latter is more linked to how energy exchange is organized.

9.3. Interview minutes

9.3.1. Egypt ERA

Interview details

Date: 28/04/2022

Present

o Med-TSO: Luca Ruffino, JuanManuel Rodriguez Garcia

o Interviewee: May Yousry,

o Engie Impact: Olivier Antoine, Basile Rosen

Held via MS Teams for one hour

Identification of the interviewee

Company: EgyptERA (Egypt national regulatory body)

Name	Position
Ms. May Youssry	Acting General Director of Planning Department
Mr. Ahmed R. Elshami	Med-TSO
Ms. Taghrid Amer	EETC

Interview Notes

Are you in line with the survey results?

First clarification required from the survey results: a score of 1 means for ERA that the topic in question is not a prerequisite for electricity exchanges. In that sense, the average score given to regulatory considerations is biased. It is also noted that the number of questions in each category can affect the average.

The two most important topics for ERA are Legal and Market. Operations aspects are already well defined in Egypt. With respect to connections, they consider the requirements at the point of common coupling as being the most important aspect for harmonization.

• To what extent should the planned interconnection with Egypt (Saudi HVDC and Greece) require further harmonization between the areas?

It is clear from answers to other questions that Egypt currently goes for bilateral long-term contracts for both these projects. One of the reasons is that long-term contracts reduce the risk for investors. Another reason is that bilateral agreements require limited harmonization However, the vision is to put in place an electricity market in the future.

 What are the main barriers for increased energy exchanges between Med-TSO countries? (From Legal, Connection, Market or Operation point of views)

EgyptERA clearly identifies Regulatory and market considerations as being the main barriers.

Do you expect differences per region? Why?

It was clearly stated by EgyptERA that the main regional priority for harmonization is EAPP.

Do you expect differences per type stakeholder? Why?

ERA expects Operations considerations to be mainly relevant for TSOs, which is in line with the survey results.

To what extent non-harmonization can be a barrier for investment in cross-border projects?

The last thing EgyptERA wants is to see investors leaving due to lack of harmonization which is why Regulatory and Market aspects need to be harmonized. About the level of harmonization, they would like to have first the same/similar topics to be applied at the regional level (not necessarily the exact same requirements and parameters).

For the future interconnection projects in Egypt, typically an agreement is achieved between the two parties (MoU), then funding is typically reached through IFIs.

• What is the regional level where harmonization is required? (None, bilateral, regional, whole Mediterranean region)

Currently, Egypt has connections with Jordan, Libya, Sudan. They foresee new ones towards Greece and Saudi Arabia. EgyptERA sees bilateral agreements to remain the norm in the near future. Currently, the long-term bilateral agreements give them the stability they need, and market integrations would lead to risks (for investors?) which should be managed by the governments. They agree that long-term contracts are not optimal for electricity prices.

They see a fully integrated market as being a more long-term consideration, and should it happen, they see an integrated market with EAPP as a must. The biggest added value of such market would be to integrate more RES in the generation mix, not really as an opportunity to import more energy. Egypt should be seen as an energy exporter and exporting is therefore the main driver for cross-border interconnections.

- To what extent do you stand by these statements from other stakeholders:
 - "For cross-border energy projects, regional political institutions should play a critical role in coordinating interests of member countries and keeping political conflicts to a minimum."
 They fully agree to this. They always look at pure economic interest and try to take decisions without any political considerations. Nevertheless, not everything is within their hands, in the end, the politics take the decisions.
 - "Harmonized regulatory framework and technical rules are already existing at EU Level and should be extended to other MED countries"

 Before harmonizing their rules with neighboring countries, they would like indeed to hear from

successful market integration stories and take advantage from the return of experience from such regions.

Other comments

- o Unbundling of the electricity sector is not under discussion in Egypt
- ERA expects Med-TSO grid code to provide guidelines for grid code compliance assessment and continuous monitoring.
- They see a gap in their grid code in terms of compliance verification and monitoring, Med-TSO could play a role to propose common regional guidelines for this.
- o Egypt is part of EAPP and expects to first to develop its trade further within the power pool
- They are not developing interconnections to have the ability to import, but the main goal is to have access to more renewable energy.

9.3.2. Energy Community

Interview details

• Date: 23/05/2022

Present

o Med-TSO: Luca Ruffino, Juan Manuel Rodriguez Garcia, Simone Biondi

o Interviewee: Jasmina Trhulj, Davor Bajs

o Engie Impact: Olivier Antoine, David Bekaert, Sarah Ouziaux

Held via MS Teams for one hour

Identification of the interviewee

Company: Energy Community

Name	Position
Ms. Jasmina Trhulj	Head of electricity
Mr. Davor Bajs	Electricity infrastructure expert

Interview Notes

Are you in line with the survey results?

The most important topics for Energy Community are topics related to the Market. They state that there is no need for developing a unique grid code for the Mediterranean Region, as the ENTSO-E Network codes are existing and can be used. It is up to non-European countries to adopt the necessary technical requirements Energy Community also states that, the non-European countries should not be convinced to follow European regulation, but regulation should be adopted through a legally binding treaty.

• What are the main barriers for increased energy exchanges between Med-TSO countries? (From Legal, Connection, Market or Operation point of views)

The main barriers are linked to a lack of infrastructure. When discussing infrastructure, it is important to keep both the 'hardware' and 'software' related aspects.

• Does this mean we need a minimum set of rules for investment? To what extent non-harmonization can be a barrier for investment in cross-border projects?

For an investment to succeed, the fact that there must be a common interest is more important than harmonization.

Energy Community also identified a barrier related to energy exchanges between member and non-member countries of ENTSO-E. The current legal framework does not allow such exchanges. The non-member country can set up an agreement for energy exchange on a voluntary basis which has its limits. There is an issue with the reciprocity – i.e. Energy Community countries are obliged to apply EU rules at the border but the EU countries not.

Do you expect differences per region? Why?

Energy is a very geopolitical issue.

As example the synchronization of Ukraine was given. Due to the war, all of a sudden synchronization was possible within weeks. Otherwise, the process would have taken years.

Energy Community is dealing with two regions, the Western Balkan, and the Black Sea Region. As the Western Balkan started the process to integrate the European union, they observe another pace in development of the energy sector. Members of the EU are faced with initiatives as the 3rd energy package, the clean energy package, RePower EU. that impose stricter requirements, targets, but also access to subsidies.

On the other hand, it is observed that every new package is more demanding than the previous one, which leads to an additional delay in catching up with these development by non-EU countries.

9.3.3. EC – DG Energy

Interview details

• Date: 13/06/2022

- Present
 - o Med-TSO: Luca Ruffino, Juan Manuel Rodriguez Garcia
 - o Interviewee: Nicolas Kuen
 - o Engie Impact: Sarah Ouziaux, David Bekaert, Basile Rosen
- Held via Google Meet for one hour

Identification of the interviewee

Company: European Commission – DG ENER

Name	Position
Nicolas Kuen	Team leader - Eastern and Southern
	Neighbourhood, Energy Community/Charter, UKTF

Interview Notes

The meeting started with an introduction of Med-TSO and of the TEASIMED initiative.

- Mr. Kuen is very active in the Balkans and East Mediterranean area.
- The DG notices that there are indeed some areas of the Mediterranean where some interconnector projects are well advanced, but also some less interconnected zones without any foreseen projects. They need incentives for building more interconnectors cause some of them are not even at planning stage. DG also mentions that the EC can finance projects from the Project of Common Interest (PCI) list. They need to be proposed by a member state.
- Med-TSO: having interconnectors is not sufficient to trade energy (taking the example of the Tunisia-Libya interconnector which was tested in 2005 & 2010 unsuccessfully). Today, these tests are not possible due to political context.
- DG agrees that synchronization is great, but it is most important to increase exchange volumes.
- DG: There is an ongoing initiative to encourage Eastern Med to export more Gas. In that frame, what is the position of Algeria within Med-TSO?

- Med-TSO: President of Med-TSO is president of Sonelgaz → they are interested and pushing for more interconnection and energy exchange. They are suffering from the lack of access to the European market.
- Q1: Are you in line with the survey results?
 - DG sees a legal harmonization as a prerequisite to any interconnection (be it as a bilateral agreement, MOU, or wider frame agreement)
 - Med-TSO sees the ongoing initiative between EC and Energy Community as an opportunity to learn from the example.
 - DG mentions that indeed, having a dedicated treaty with Med area would help. To do so, Med-TSO needs to put this on a formal note for discussion with EC.
- Q2: To what extent non-harmonization can be a barrier for investment in cross-border projects?
 - DG: It is more about the security of the investment. The political stability of the region is not always a given → if the risk is too high, so will be the price gap. In that sense, having a project on the PCI list secures funding and helps building on stability. In certain cases, other political points of discussion play a role whether progress on cross-border projects is made or not.
 - To be noted: PCI only finances the European part (member state) → there are other ways to finance the other part.
